COURSE DESCRIPTION

In our free, self-paced Android Developer Fundamentals training, you learn basic Android programming concepts using the Java programming language. You build a variety of apps, starting with Hello World and working your way up to apps that update settings, understanding product structure and android studio interface. You will be able to learn basic how to create android application. After this course you can easily create simple android application.

Requirements

Basic Knowledge of IT.

COURSE CONTENTS

Advanced Website Development

Setting Up Android Development Environment

src="https://www.youtube.com/embed/pWgkulvDdc0" width="560" height="315" frameborder="0" meta_icon="fa fa-file-text-o"]

- What is Android App
- Downloading Software (Android Studio)
- Installation Requirements for Android Studio
- Installing Android Studio
- Create a test Android app
- Installing Virtual Device

- Running android app in multiple devices

[/stm_course_lesson][stm_course_lesson icon="fa fa-file-text-o" badge="exercise" title="Android Studio Interface" meta_icon="fa fa-file-text-o"]

- Understanding Project Structure
- Accessing your Projects
- Component Tree
- The Palette
- Gradle Build System
- Understanding Types of Layouts in Android
- User Interface

[/stm_course_lesson][stm_course_lesson icon="fa fa-file-text-o" badge="exercise" title="Creating your First App Design" meta_icon="fa fa-file-text-o"]

- Constraint Layout
- Relative Layout
- Linear Layout
- Working with Text Views
- Text Size, Margin and Padding
- Edit Text
- Button
- Styling your app

[/stm_course_lesson][stm_course_lesson icon="fa fa-file-text-o" badge="exercise" title="Understanding Basic XML Structure" meta_icon="fa fa-file-text-o"]

- What is XML
- XML Syntax
- XML Attributes
- XML Document Structure
- XML Tags
- XML Elements

[/stm_course_lesson][stm_course_lesson icon="fa fa-file-text-o" badge="exercise" title="Understanding Basic Java" meta_icon="fa fa-file-text-o"]

- What is Java
- Setting Up Java development Environment
- Coding your first Java Program
- What is Java package
- Data Types
- Basic operators
- Variables
- Arrays

[/stm_course_lesson][stm_course_lesson icon="fa fa-file-text-o" badge="exercise" title="Creating your First App Logic" meta_icon="fa fa-file-text-o"]

- Creating a new Project
- Designing your app
- Adding image to your app
- Adding text field
- Adding button
- Creating the app logic
- Adding an icon for your app
- Creating Activities

- Understanding Intent
- Going back to previous activity
- Accessing your app on a real device

COURSE DESCRIPTION

A static web page (sometimes called a flat page/stationary page) is a web page that is delivered to the user exactly as stored, in contrast to dynamic web pages which are generated by a web application. Consequently a static web page displays the same information for all users, from all contexts, subject to modern capabilities of a web server to negotiate content-type or language of the document where such versions are available and the server is configured to do so. Static web pages are often HTML documents stored as files in the file system and made available by the web server over HTTP (nevertheless URLs ending with ".html" are not always static). However, loose interpretations of the term could include web pages stored in a database, and could even include pages formatted using a template and served through an application server, as long as the page served is unchanging and presented essentially as stored. Static web pages are suitable for the contents that never or rarely need to be updated. However, maintaining large numbers of static pages as files can be impractical without automated tools. Any personalization or interactivity has to run client-side, which is restricting.

COURSE DESCRIPTION

A servlet is a small program that runs on a server. The term was coined in the context of the Java applet, a small program that is sent as a separate file along with a Web (HTML) page. Java applets, usually intended for running on a client, can result in such services as performing a calculation for a user or positioning an image based on user interaction. Some programs, often those that access databases based on user input, need to be on the server. Typically, these have been implemented using a Common Gateway Interface (CGI) application. However, with a Java running in the server, such programs can be implemented with the Java programming language. The advantage of a Java servlet on servers with lots of traffic is that they can execute more quickly than CGI applications. Rather than causing a separate program process to be created, each user request is invoked as a thread in a single daemon process, meaning that the amount of system overhead for each request is slight.
